Translational research at DZNE

DZNE scientists explore the similarities and differences of various brain diseases with the aim of developing new preventive and therapeutic approaches.

Fundamental research at DZNE is closely linked to clinical research to enable rapid development of new therapies.

Only through close collaboration of multidisciplinary partners can an efficient translational approach to our research be realized. Therefore, the translational approach to our research is key.

The aim of translational research is a continuous dialog within all of our research areas, including an internal exchange and also with our partners from universities, research institutions, hospitals and the pharmaceutical industry. This will accelerate the conversion of results into application.

True to the motto "from bench to bedside and back to the bench".
