The working groups of the DZNE in Tübingen study the causes and effects of neurodegenerative diseases of the aging human brain, particularly Parkinson's and Alzheimer's disease, Fronto temporal Dementia, Motor Neuron Disease, Ataxia's and Spastic Paraplegia.

The research is translated into new strategies for diagnosis, prevention, and treatment. This calls for a research environment and an infrastructure that allow the recruitment of top-class scientists and the identification of basic research areas that promise innovative applications of clinical relevance in diagnosis and treatment.
For this purpose, the site in Tübingen has established nine research groups, which collaborate closely with other researchers at the Tübingen Research Campus.
University Clinic Tubingen; the Hertie Institute for Clinical Brain Research

The DZNE- Tübingen participates in a research-oriented, English-speaking generations of young scientists.

The research groups of the DZNE are located in the new DZNE building
